While reviewing the projects the biggest challenge was to find something worth commenting on, because the code was either written very well and you couldn't point out any mistakes or the code was too messy and there were no comments explaining what it does. Sometimes when I found an issue it was already commented on by someone else, so I really had to look hard for the one noone noticed by then. When reviewing I tried to be nicer that I was before and tried to compliment people if I liked what they did with the code. I also learned that I could have done one of my assignments in a much simpler way by reading the solutions of my colleagues.
